<div class="df\_qntext">Are vanadium redox flow batteries better than lithium-ion batteries?

Our research paper focuses on vanadium redox flow batteries (VRFB), which offer relatively low efficiency compared to lithium-ion batteries, while the lifetime expectancy can be twice as high up to 20,000 cycles. The energy capacity of VRFB can be decoupled from the system power.

<div class="df\_qntext">What is the electrolyte temperature of vanadium redox flow batteries?

Pipes and the stack are the critical components for winter and summer operations. Thermal radiation and global irradiance remarkably affect the electrolyte temperature. To avoid thermal precipitation, the electrolyte temperature of vanadium redox flow batteries should be within 5-40 °C.

<div class="df\_qntext">How does a vanadium redox flow battery work?

Fig. 1 a shows the schematic view of a vanadium redox flow battery. The electrolyte is circulated through a pipe system into the cells from the tanks. (R1),(R2) occur in the negative and positive half-cells to generate electric power from chemically stored energy.

<div class="df\_qntext">Can GHI data be used to simulate a photovoltaic power plant?

Moreover, even though it will be the scope of an upcoming paper, the 1-min resolution GHI data could also be used to accurately simulate the power output of a photovoltaic power plant coupled with the VRFB by a physical model chain. Table 4 contains the detailed weather data from every investigated station.

<div class="df\_qntext">How much power does a solar battery have?

The maximal stack power is 4.5 kW with the used charging curve, while the theoretical capacity is 30 kWh. An inverter is necessary to enable the battery to supply alternating current to the grid, and it is assumed that the battery is charged from the grid instead of directly from a solar cell.
