

Application of solar container batteries in big data centers

<div class="df_qntext">Why do data centers use battery energy storage systems?

The reason is that, in high-reliability grids like the Hong Kong power grid, data centers rely less on battery energy storage systems, and therefore the battery energy storage systems provide more surplus energy for energy flexibility services and obtain higher revenues.

<div class="df_qntext">Do battery energy storage systems affect Tier II data centers?

Furthermore, battery energy storage systems have a more considerable economic impact on Tier II data centers. Moreover, Fig. 12 reveals that as power grid reliability decreases, the revenues from providing energy flexibility services decrease at an accelerated rate of Tier IV data centers.

<div class="df_qntext">Are large-scale battery systems a viable option for data center backup?

With the dramatic improvements in lithium-ion battery technology, large-scale battery systems have become viable for data center backup and energy optimization. Lithium-ion batteries offer fast response, high energy density, and dropping costs. Tech giants and colocation providers are now experimenting with or deploying big battery banks on-site.

<div class="df_qntext">Which tiers of data centers are most affected by battery energy storage?

Among all tiers of data centers, the economic impact of the battery energy storage system is most significant on Tier II data centers.

<div class="df_qntext">What is battery energy storage?

In addition to DGs, battery energy storage can also serve as a component of backup power systems in data centers. According to the specifications and standards of data centers in different regions or countries, the standard battery stored energy time (SET) is usually 15 min to ensure the normal operation of the data center.

<div class="df_qntext">How much energy does a data center use?

On the other hand, the energy consumption of data centers is increasingly becoming a focus of attention in the power industry. Specifically, data centers consume 1.3 % of the world's electricity, highlighting the economic impacts of data center battery energy storage.
