

<div class="df\_qntext">Can carbon fiber be used to make nacre-like Bionic composites?

Therefore, in this study, a new type of carbon-fiber reinforced ceramic-based nacre bionic composites was prepared by incorporating chopped carbon fibers into the nacre-like structure. In this investigation, a nacre-like bionic ceramic scaffold was designed and successfully fabricated using the VPP technique, for the first time.

<div class="df\_qntext">Can nacre-like Bionic scaffolds be 3D-printed?

In this study, nacre-like bionic ceramic scaffolds were 3D-printed using vat photopolymerization (VPP) technology, filled with polymer, and reinforced with carbon fiber to create high-strength and high-toughness carbon fiber-reinforced bionic composites.

<div class="df\_qntext">What materials are used in Bionic solar evaporators?

To summarize, we have reviewed various bionic solar evaporators with different materials, structures, design strategies, and promising applications. Various photothermal materials, including carbon-based materials, metal materials, semiconductor materials and polymer materials, have been explored for solar-heat conversion.

<div class="df\_qntext">What is carbon fiber & nanotechnology?

Carbon fiber has the potential to be used in the design of sensors and electronics due to its conductivity and strength. 3. Nanotechnology Nanotechnology has the potential to improve the performance and durability of prosthetic devices.

<div class="df\_qntext">Are carbon fiber prosthetics a good choice?

Carbon fiber is an increasingly popular material for use in prosthetic devices due to its strength, flexibility, durability, and aesthetic appeal. While there are some potential drawbacks to consider, the benefits of the composite prosthetics are significant and can have a profound impact on the lives of patients.

<div class="df\_qntext">What is a bionic solar-driven interfacial evaporation system?

As presented in Fig. 9b, Wang et al. proposed a bionic solar-driven interfacial evaporation system consisting of a cotton wick as water transportation vessel and polystyrene as solar absorber. Its evaporation rate is 1.54 kg m<sup>-2</sup> h<sup>-1</sup> under 1 sun.

Using renewable solar energy sources instead of heat energy to desorb CO<sub>2</sub> from adsorbents is a promising strategy for reducing the energy consumption of adsorbent regeneration. However, the ...

The self-floatation ability, low cost, well solar evaporation performance, and easy preparation contribute to the promising potential of using hydrophobic carbonized coffee grounds ...

Made a pioneering attempt to use the lattice sandwich structure in prosthetic foot design and pioneered the

study for the lay-up design of the prosthetic foot. An innovative carbon fiber bionic prosthetic foot ...

This article will present what is currently known about carbon fiber prostheses with built-in ankle joint as well as new research on the powered ankle and the evolution from early prosthetic feet ...

Here, a novel solar energy-triggered regenerative bionic fiber adsorbent for CO<sub>2</sub> capture was designed via bionic electrostatic and chemical cross-linking assembly of cellulose ...

The design of bionic helical structures significantly enhances load-bearing capacity and impact resistance, demonstrating great potential for mechanical property improvement. However, there is still ...

Solar interfacial evaporators (SIEs) with directional tubular structure have been well studied in seawater desalination. However, the lower water transporting ability always limits vaporizing rate. Herein, ...

Therefore, in this study, a new type of carbon-fiber reinforced ceramic-based nacre bionic composites was prepared by incorporating chopped carbon fibers into the nacre-like structure. ...

These structures bring owl feathers excellent mechanical properties. Inspired by the natural structure of owl feathers, a weaving technique and a sizing process were combined to ...

The largest category of feet for active individuals with a transtibial amputation is energy storage and return (ESR) feet. These feet are typically constructed of carbon fiber composite ...

Plant leaves' remarkable structural and functional diversity makes them a highly effective bionic prototype for scientific research. Bionic research inspired by plant leaves has led to ...

In this study, nacre-like bionic ceramic scaffolds were 3D-printed using vat photopolymerization (VPP) technology, filled with polymer, and reinforced with carbon fiber to create ...

Insufficient interfacial activity and poor wettability between fibers and matrix are the two main factors limiting the improvement of mechanical properties of Carbon Fiber Reinforced Plastics ...

Highlights o Carbon fiber-Mg foam sandwiches combine multiple functional properties. o Inspired by biostructure of cattle vertebral body, bionic sandwiches were designed. o

We have successfully designed a wearable high efficient multiband spectral regulation fiber (MSRF) with a bioinspired vine-stems structure using carbon fiber and polyaniline (PANI) as the active layer.

Based on liquid-phase oxidation, wettability of carbon fiber was improved, which enhanced bonding strength between reinforcement and matrix and built material base for mechanical strength of bionic ...

## Carbon fiber bionic solar container feet

An innovative carbon fiber bionic prosthetic foot was designed using a sandwich structure. The effect of cross-ply on the prosthetic foot's energy storage properties and vibration characteristics was ...

To determine the energy cost of walking (ECW) of a bionic foot (Proprio-Foot<sup>®</sup>;) during ambulation on floor and on treadmill (at different slopes) compared to walking with a dynamic carbon fiber foot ...

These include bionic and non-bionic methods and they have their own advantages and disadvantages. In this paper, a variety of bionic amphibious robots that have been designed over the ...

This paper successfully fabricated helical carbon fiber tows using a carbon fiber twisting technique and introduced a novel intersecting circular cross-section model to thoroughly investigate ...

The carbon fiber used in the load-bearing structural components often exhibits a relatively low toughness and a limited elongation at the point of failure within its carbon fiber tows. To ...

Let's face it - when you think about domestic carbon fiber energy storage feet, your first thought might be "Are we talking about robot shoes?" Not quite. These unassuming components are quietly ...

Carbon fiber reinforced plastic (CFRP) laminates are widely used in vessel side plate, underwater propeller, and submarine oil pipeline because they possess superior specific strength and ...
