<div class="df_qntext">Are molecular Photoelectrochemical Energy Storage materials effective?

In contrast, molecular photoelectrochemical energy storage materials are promising for their mechanism of exciton-involved redox reaction that allows for extra energy utilization from hot excitons generated by superbandgap excitation and localized heat after absorption of sub-bandgap photons.

<div class="df_qntext">What is solar-to-electrochemical energy storage?

Molecular Photoelectrochemical Energy Storage Materials for Coupled Solar Batteries
Solar-to-electrochemical energy storage is one of the essential solar energy utilization pathways alongside solar-to-electricity and solar-to-chemical conversion.

<div class="df_qntext">Are solar-based devices suitable for (photo)electrochemical hydrogen generation and reversible storage?

In Section 3, several architectures of solar-based devices for (photo)electrochemical hydrogen generation and reversible storage were critically discussed from the perspective of the operating principles, (photo)electrochemical performance of integrated components, and the overall efficiency of hydrogen generation, storage, and release.

<div class="df_qntext">Why do we need solar energy conversion devices?

As global energy demands shift towards renewable integration, electrified transportation, and smart grid applications, significant advancements in batteries, supercapacitors, and solar energy conversion devices are required to enhance performance, longevity, and sustainability.

<div class="df_qntext">What is Photoelectrochemical Energy Storage (PES)?

Newly developed photoelectrochemical energy storage (PES) devices can effectively convert and store solar energy in one two-electrode battery, simplifying the configuration and decreasing the external energy loss.

<div class="df_qntext">Can solar energy storage be based on PES materials?

Based on PES materials, the PES devices could realize direct solar-to-electrochemical energy storage, which is fundamentally different from photo (electro)catalytic cells (solar-to-chemical energy conversion) and photovoltaic cells (solar-to-electricity energy conversion).
