

<div class="df\_qntext">Why are electrochemical energy conversion and storage technologies important?

The global transition towards renewable energy sources, driven by concerns over climate change and the need for sustainable power generation, has brought electrochemical energy conversion and storage technologies into sharp focus [1, 2].

<div class="df\_qntext">Can flow batteries and regenerative fuel cells transform the energy industry?

Flow batteries and regenerative fuel cells have the potential to play a pivotal role in this transformation by enabling greater integration of variable renewable generation and providing resilient, grid-scale energy storage.

<div class="df\_qntext">What role do environmental policies play in solar-driven (photo)electrochemical technologies?

Environmental policies, such as renewable energy subsidies and grants, environmental regulations and carbon taxes, will also have an important role in the broader implementation of solar-driven (photo)electrochemical technologies.

<div class="df\_qntext">Can alternative chemical reactions improve the economic competitiveness of solar-driven (photo)electrochemical devices?

Alternative chemical reactions at both the anodic and cathodic side, as well as coupled and tandem reactions, can enhance the economic competitiveness of solar-driven (photo)electrochemical devices. Depending on their market price and demand, different implementation strategies are required.

<div class="df\_qntext">Should a centralized facility be used for high-price and low-demand chemicals?

Depending on their market price and demand, different implementation strategies are required. Low-price and high-demand chemicals benefit from having a single-product centralized facility, whereas a multi-product decentralized facility is preferred for high-price and low-demand chemicals.

<div class="df\_qntext">Which electrochemical synthetic approaches are driven by sunlight?

In this Review, we outline valuable electrochemical synthetic approaches that are driven by sunlight (either directly or indirectly) and include alternative reactions that replace O<sub>2</sub> evolution, hydrogenate feedstocks using water as the proton source or integrate downstream utilization of H<sub>2</sub> in the same device.
