

Oil switch cannot store energy

<div class="df_qntext">What happens if you overcharge an oil separator?

Oil overcharge will cause the oil separator to be inefficient, and oil will carry over to evaporator, causing foaming and refrigerant carry over to oil separators. This causes refrigerant to flash in the oil separator and lower the oil temperature. Sometimes the oil separators will vibrate due to the refrigerant boiling off.

<div class="df_qntext">What is oil system fault?

Description of Fault: Entering oil temperature on either compressor of the given circuit reads a temperature of 4 F below the given ckt saturated condenser temperature for more than 30 mins. Where 4F is the oil loss differential. (2 F hysteresis to clear timer). Oil System Fault can be caused by numerous issues; items to test, check, and verify:

<div class="df_qntext">Why do oil separators vibrate?

Sometimes the oil separators will vibrate due to the refrigerant boiling off. The oil separators will feel cooler than normal. Notes: Field Testing Example: Conclusion: the differential pressure (suction to discharge) = 75 psi and across the compressor (Oil Filter Cover-plate to Bearing Housing) is 0 psi.
