<div class="df_qntext">How do electrode manufacturing steps affect battery performance?

In the present work, the main electrode manufacturing steps are discussed together with their influence on electrode morphology and interface properties, influencing in turn parameters such as porosity, tortuosity or effective transport coefficient and, therefore, battery performance.

<div class="df_qntext">Is MN based positive electrode a viable aqueous zinc-ion battery?

Provided by the Springer Nature SharedIt content-sharing initiative Engineering the formulation of an Mn-based positive electrode is a viable strategy for producing an efficient aqueous zinc-ion battery. However, Mn dissolution and the byproducts result in capacity fading, thus limiting its electrochemical performances.

<div class="df_qntext">How to test the electrochemical performance of CR2016 coin-type batteries?

The electrochemical performances are tested by assembling the CR2016 coin-type batteries or pouch cell with the Zn foil negative electrode ($\geq 99.9\%$), glass fiber separator, MnO₂ positive electrode, and various electrolytes.

<div class="df_qntext">What is the function of electrodes in a battery?

The electrodes do not only store electrical energy. They also connect to the terminals and act as current collectors, allowing current to flow through an external circuit or electric load. Battery cell plates, or electrodes, are referred to by their polarity. As such, we have the positive and negative plates.

<div class="df_qntext">What is the active material on a lithium ion electrode?

The active material on the positive electrode is a lithium-based compound like lithium cobalt oxide, lithium iron phosphate, lithium manganese, and lithium titanate. The negative electrode, anode, is a graphitic structure or another carbon material.

<div class="df_qntext">What causes capacity fading in Zn-MNO₂ batteries?

A simple substitution method replacing either the positive electrode or negative electrode with a new one individually is used to demonstrate the capacity fading in Zn-MnO₂ batteries is caused by the positive electrode (Supplementary Fig. 1).
