

<div class="df_qntext">Can ferroelectric materials be used in solar energy devices?

Here, the charge transportation is not limited by diffusion, and V_{oc} is not restricted to the energy barrier (energy band gap). Exploitation of suitable ferroelectric materials having narrow-band gap useful for visible region are promising for their potential application in both novel optoelectronic and the solar energy devices.

6.1. Overview

<div class="df_qntext">Why is ferroelectrics a promising energy storage material?

Due to its properties of high energy density, wide operating temperature range T , quick charge-discharge ability and extended active life, ferroelectrics is a kind of prospective and promising energy storage material [7, 8, 9, 10, 11, 12, 13].

<div class="df_qntext">Can porous ferroelectric ceramics be used for energy harvesting?

The main focus of this review is to investigate the synthesis methods, microstructural evolution, and mechanical properties of porous ferroelectric ceramics, which further extends to the applications of these materials in energy harvesting, catalysis, and sensing.

<div class="df_qntext">What makes ferroelectric photovoltaics different from p-n based solar cells?

Another unique feature of ferroelectric photovoltaics is that, unlike p-n based solar cells, the photovoltage of FePvs is not limited by the material's bandgap (E_g); open circuit voltages (V_{OC}) as large as 1600 V have been measured in LiNbO_3 .

<div class="df_qntext">How can energy storage and conversion be realized in ferroelectrics?

Scientific Reports 15, Article number: 7446 (2025) Cite this article The energy storage and conversion in ferroelectrics can be realized through the microstructures of polar domains and domain walls, which resulting in the transformations from macro/microdomains to nanodomains or forming complex polar topologies.

<div class="df_qntext">Can ferroelectric ceramics drive photocatalytic reactions?

Ferroelectrics ceramics are known as semiconductors with a wide band gap, which produce photogenerated free charge carriers under the exposure of light energy equal to or more than their band gap energy [33]. Thus, ferroelectric ceramics are able to drive photocatalytic reactions and thus have potential for driving photocatalytic applications.
