Why is a financial model important for a solar PV project?

<div class="df_qntext">How does a solar PV project finance?

Debt Financing Structure: Solar PV projects often utilize project finance structures involving a syndicate of lenders. Model debt terms including senior and subordinated tranches, interest rates (fixed vs. floating), tenors, debt sculpting, interest rate hedging mechanisms, and grace periods.

<div class="df_qntext">How many solar PV projects are there in 2020?

Between 2010 and 2020, the number of solar PV projects awarded through competitive auctions and tracked by IRENA have increased more than 50-fold from 55 projects in 3 countries for 2010 to 3114 projects in 19 countries for 2020.

<div class="df_qntext">Why is a financial model important for a solar PV project?

The growing adoption of renewable energy is driving a global transformation in how we produce and consume power, with solar photovoltaics (PV) leading the charge. Building a robust financial model for a solar PV project is crucial for evaluating project feasibility, managing complex risks, and ensuring investor confidence.

<div class="df_qntext">Does solar PV cost a government bond?

Both show negative solar PV premiums ranging from -2% to -2.7%, which means that we calculate a financing cost for solar PV that is below the financing cost for the government, i.e., a 10-year government bond. While there may be cases where this is plausible, it is unlikely for Brazil and China.

<div class="df_qntext">How do risk premiums affect solar PV projects?

To understand the risk premiums of PV projects, we split up the CoC into a base rate, using a 10-year US government bond yields plus country risk premiums (Damodaran, 2022), and a solar PV premium. The results show that the CoC declines are mainly due to lower solar PV risk premiums whereas base rates have stayed roughly constant.

<div class="df_qntext">Why is PV better than other RE technologies?

In major markets, PV often features (a) lower CAPEX variations across projects and countries than other RE technologies (IRENA, 2022a) and (b) generally experiences low O&M costs (Steffen et al., 2020). These characteristics reduce the potential error in calculating the CoC if project-level cost components are not fully reliable or unavailable.

Based on a new, unique dataset from a global survey, this IRENA report presents unprecedented insights on the cost of capital for onshore wind, offshore wind and solar photovoltaic (PV) projects.
