<div class="df_qntext">How to deal with high Battery-generated heat load?

To deal with the high battery-generated heat load, appropriate thermal management strategies should be implemented. Normally, battery cooling technologies include air cooling 6,7,8,9, phase change material (PCM) cooling 10, and liquid cooling 11,12.

<div class="df_qntext">How to prevent thermal runaway in lithium-ion batteries?

Excessive discharge magnification is likely to lead to rapid heating of batteries and trigger thermal runaway. Establishing good discharge conditions or effective active thermal control may be the key to thermal control and preventing thermal runaway in lithium-ion batteries.

<div class="df_qntext">Does a lithium-ion battery have a non-uniform heat production distribution model?

This study investigates the electro-thermal characteristics and non-uniform heat generation of a 100 Ah lithium-ion battery. A current-adaptive non-uniform heat production distribution model is developed. The impact of various liquid cooling configurations on the heat dissipation efficiency of the battery module is studied in detail.

<div class="df_qntext">Why is aluminium a good material for batteries?

While the material ensures the greatest possible formability during the production of cell housings, the material impresses with its high surface quality, strength and excellent thermal conductivity after processing into a component. The high thermal conductivity of aluminium can significantly improve the thermal management of batteries.
