<div class="df\_qntext">What is an auxiliary contactor?

An auxiliary contactor is a contactor with built-in auxiliary contacts. These additional contacts provide valuable functionalities within the control circuit, independent of the main power circuit handled by the contactor. This allows for various control and signalling purposes within the automation system.

<div class="df\_qntext">Why do RS contactors have auxiliary contacts?

RS contactors have auxiliary contacts to provide valuable feedback on the contactor's position (open or closed). This information can be used for control logic or to display the motor's current direction on a control panel. This safeguards against equipment damage and potential accidents.

<div class="df\_qntext">What are relay auxiliary contacts?

Relay auxiliary contacts are additional switches within circuit breakers and contactors. They are particularly valuable in applications with limited space, as they eliminate the need for separate contactors and simplify control circuits.

<div class="df\_qntext">What are auxiliary contacts in an MCB?

In an MCB, auxiliary contacts are utilised primarily in control circuits, indication circuits, and feedback circuits. They are not the main contacts that connect the load to the supply, which are NO (normally open) contacts.

<div class="df\_qntext">What are auxiliary contacts?

Auxiliary contacts are additional contacts provided by a main contactor or relay. They act as the "eyes and ears" of the device, providing information about its state - whether it's currently energized or de-energized - and enabling the creation of more sophisticated and safer control schemes.

<div class="df\_qntext">What is an NO auxiliary contact?

An NO (Normally Open) auxiliary contact can be used to energize a pilot light on a control panel when the main contactor is engaged and the motor is running. Similarly, an NC (Normally Closed) contact could indicate when the motor is stopped.
