<div class="df\_qntext">Does maintenance affect the life cycle of an offshore wind farm?

Compared with operations, maintenance is a critical element in the levelized cost of energy, given the practical constraints imposed by offshore operations and the relatively high costs. The effects of maintenance on the life cycle of an offshore wind farm are highly complex and uncertain.

<div class="df\_qntext">Why is maintenance important for offshore wind turbines?

Operations and maintenance of offshore wind turbines (OWTs) play an important role in the development of offshore wind farms. Compared with operations, maintenance is a critical element in the levelized cost of energy, given the practical constraints imposed by offshore operations and the relatively high costs.

<div class="df\_qntext">What is offshore wind farm operation & maintenance (O&M)?

This project is cooperation between ECN, MARIN, TNO, BMO Offshore, Carbon Trust and Dutch industry participants. Offshore wind farm Operation and Maintenance ("O&M") costs are a major part of levelised cost of energy, and significant opportunities exist for improving O&M strategies to reduce costs.

<div class="df\_qntext">How do offshore wind farms work?

Current offshore wind farms are operated from a single harbour location. The common trend in each country is to make two or three offshore hubs for O&M. These locations are commercial harbours either dedicated for offshore wind or are shared with other sea-port business.

<div class="df\_qntext">Who is responsible for O&M for offshore wind farms?

Moreover, in practical O&M for offshore wind farms, it is common for the original equipment manufacturer (OEM) or maintenance service provider to assume dual roles as decision-makers responsible for both maintenance planning and spare parts provision.

<div class="df\_qntext">What are the characteristics of an offshore wind farm?

(1) All the components in the offshore wind farm are brand new at the beginning of operation. (2) The inspection and RUL prediction are performed at a regular interval, regardless of the time elapsed since the last maintenance of the individual components. (3) Inspections are nondestructive and RUL prediction is accurate.
