

The prospects of superconductor solar container

<div class="df_qntext">Can high-temperature superconductor cable be used in space solar power stations?

Abstract: Compared to traditional metal cable, high-temperature superconductor (HTS) cable is a promising candidate for the energy transmission in space solar power stations due to its great advantage in high power density and efficiency.

<div class="df_qntext">Can superconducting cable power transmission reduce spacecraft energy transfer?

These cables can reduce energy losses and simplify the conventional cable transmission by eliminating the need for voltage conversion equipment, thus reducing the launch weight and costs of spacecraft. This paper analyzes the feasibility of superconducting cable power transmission in space spacecraft energy transfer.

<div class="df_qntext">Are superconductors the future of quantum computing?

Within electronics, superconductors have a potential role to play in the advance of both quantum and classical computing. For quantum computing -- our technology of the year for 2025 -- qubits based on superconducting circuits are currently a leading platform in the race to build a practical system.

<div class="df_qntext">Which DC superconductor projects are demonstrating longer cable deployments?

Another important DC superconductor project in demonstrating longer cable deployments is the proposed HTS DC transmission cable in St. Petersburg, Russia. The project consists of a 2.5 km long 20 kV cable capable of transmitting 50 MW of power. The cryogenic system is a closed-loop system with two circuits and cooled with liquid nitrogen.

<div class="df_qntext">Can superconducting magnetic energy storage (SMES) units improve power quality?

Furthermore, the study in presented an improved block-sparse adaptive Bayesian algorithm for completely controlling proportional-integral (PI) regulators in superconducting magnetic energy storage (SMES) devices. The results indicate that regulated SMES units can increase the power quality of wind farms.

<div class="df_qntext">What are examples of superconductors?

Superconductors are materials that offer no resistance to electrical current. Prominent examples of superconductors include aluminium, niobium, magnesium diboride, cuprates such as yttrium barium copper oxide and iron pnictides. These materials only become superconducting at temperatures below a certain value, known as the critical temperature.
