<div class="df_qntext">How to connect a solar panel to a supercapacitor?

To connect a solar panel to a supercapacitor, follow these steps: Connect the 2 supercapacitor banks on their respective places on the balance board. All other circuits, including the solar panel, are soldered in the same place. Connect all plus wires (brown) from the solar panel and the capacitors to the positive plate. Connect all minus wires (white) from the solar panel and the capacitors to the negative plate. Put the board in the box, so you can close it.

<div class="df_qntext">How to use a flying capacitor in an inverter?

For the appropriate operation of the inverter the flying capacitor voltage has to be half of the input voltage. For the voltage regulation the voltage of the flying capacitor, the input voltage and the output current direction need to be considered. Those have to be measured in the inverter.

<div class="df_qntext">Are supercapacitors suitable for solar charging?

Supercapacitors are suitable for solar charging because they can handle non-stop charging/discharging cycles with different currents and unstable parameters. They last longer than batteries and this device can be used for a very long time. In this project, I decided to use supercapacitors instead of batteries for this reason.

<div class="df_qntext">How to charge Supercaps from solar panel?

The best way to charge supercaps from a solar panel, according to the passage, is by using the ZSPM4523 chip. This chip is optimized for this purpose and has a built-in MPPT charger. However, it seems that two of these chips might be needed for charging two packs of supercaps. The cost of the chip is around 3\$, but the speaker mentions they cannot solder SMD components.

<div class="df_qntext">Can you put two capacitors in a series?

Yes, you can, but placing two capacitors in series halves their capacitance, so you will have to place two sets of series caps in parallel. Don't know if that will be more compact than a single 1000 u u F/6.3V type. Costly it will be in any case... AVX has some compact SMD tantalums, 1000 u u F/6.3V.

<div class="df_qntext">Do capacitors need balancing?

Capacitors have a capacity. If they're showing different voltages at rest, they likely have different capacities and no amount of balancing is going to be helpful as the caps could potentially overwhelm any current the balancers can deliver. On a completely unrelated note... I see you're from the Netherlands... Your avatar is blue...

One very simple low cost and effective way to prevent super caps from drifting too far out of balance over time, is to simply connect an appropriate LED across each cap. Depending on the ...

SupercapacitorsCharging ElectronicsSolar PanelDischarging ElectronicsOtherI chose a solar panel 5.5V (it gives more on direct sunshine), but 6V is OK too. It should be able to charge both supercapacitor banks up to 2.7V ($2 \times 2.7 = 5.4V$). Normally it reaches 5.2V when charged.
