

# What are the types of land use for solar container power stations

<div class="df\_qntext">What is a photovoltaic power station?

A photovoltaic power station, also known as a solar park, solar farm, or solar power plant, is a large-scale grid-connected photovoltaic power system (PV system) designed for the supply of merchant power.

<div class="df\_qntext">Which land types are used for PV stations?

Our research validates that deserts, gobi, and low-coverage grasslands are the predominant land types used for PV stations. Moreover, the design of PV arrays should be based on ecological principles to foster a more sustainable energy future. Ecologically, the construction of PV structures leads to temperature changes.

<div class="df\_qntext">Is solar energy a good option for land use?

However, recent studies based on satellite views of utility-scale solar energy (USSE) under operation, either in the form of photovoltaics (PV) or concentrated solar power (CSP), show that their land use efficiency (LUE) is up to six times lower than initial estimates<sup>17,18,19</sup>.

<div class="df\_qntext">Which type of land is suitable for solar PV installation?

These special types of land, often with harsh natural environment, low land utilization rate and abundant solar radiation, are more suitable for large area installation of PV facilities, with green energy to drive innovative applications and land transformation, to achieve simultaneous development of economic and ecological benefits.

<div class="df\_qntext">How much land does solar energy occupy?

A novel method is developed within an integrated assessment model which links socioeconomic, energy, land and climate systems. At 25-80% penetration in the electricity mix of those regions by 2050, we find that solar energy may occupy 0.5-5% of total land.

<div class="df\_qntext">How is land used for PV projects?

Land for PV is primarily acquired through lease agreements with relevant stakeholders, ensuring protection against the use of arable land. Forest lands utilized for PV projects prioritize areas with limited annual precipitation or shrub coverage, while grasslands focus on compatibility between solar projects and local ecology.
