<div class="df_qntext">How does vacuum work in solar still desalination systems?

Applied vacuum conditions in solar still systems can be natural by the height of the water column or forced by a vacuum pump [7]. Natural vacuum saves more energy than forced vacuum in solar still desalination systems, as the vacuum pump consumes the energy needed to operate it [127].

<div class="df_qntext">What is a forced vacuum solar still system?

In the forced vacuum solar still systems, forced vacuum techniques are used to create the vacuum conditions and release the NCG into the ambient. In the natural vacuum solar still systems, the various methods used to extract the NCG are such as a direct extraction technique [129], a vacuum pump [33], and a water ring vacuum pump [133].

<div class="df_qntext">What are the benefits of forced vacuum evaporation in solar still systems?

Forced vacuum Vacuum conditions created in the solar still systems improve the efficiency of the main operations; it makes the evaporation process take place at lower temperatures and with lower energy consumption, which leads to less energy loss to the surrounding environment.

<div class="df_qntext">How does vacuum technology affect the efficiency of solar still systems?

The vacuum technology in the solar still system has a positive impact on both its productivity and efficiency, as it contributed to an improvement of about 47%, and 40% for each, respectively when compared to that of the conventional solar still under normal atmospheric pressure.

<div class="df_qntext">Do solar still systems need a vacuum?

Solar still systems are reviewed with an emphasis on vacuum circumstances. Two methods for applying vacuum conditions; natural and forced vacuum. Forced vacuums account for 52% of all vacuums, while natural vacuums account for 48%. Natural vacuum accompanies problems related to maintenance and space requirements.

<div class="df_qntext">How does vacuum evaporation affect solar energy consumption?

The vacuum technique optimizes all operations of the solar still system, where in the evaporation process, it leads to quick access to the boiling temperature of seawater and thus speeds the evaporation process and reduces the amount of energy consumption, which had a positive effect on the energy consumption process.
